

User just submitted the survey 'Questionnaire' with the responses below.

What works well in the proposed policy for managing flying-foxes?

Consultations with the local community & businesses about remedies to the issue.

What could be improved?

Lack of a timeline for action in problem areas. Lack of prioritising action in areas of high human population density accompanied with high bat population density.

From your experience are there other things that could be included?

Provision of an alternative "safe" zone for the bats to move to (which has appropriate flora & fauna) would prove to bring better long term results for relocation instead of dispersing alone!

Any other comments?
