How we make decisions

The Department of Planning, Industry and Environment is supporting the health and resilience of rivers and wetlands by delivering water for the environment where and when it is needed.

We use the best available science, management expertise and experience to manage water across the landscape. This statement of annual priorities identifies the waterways and wetlands that are likely to receive water.

As rainfall is hard to predict, our decision-making process considers:

- expected availability of water in the coming year
- conditions of the previous year
- current health of the plants and animals in these ecosystems.

Community-based environmental water advisory groups provide feedback and advice to the Department on the management of water for the environment.

The NSW Government works with the Commonwealth Environmental Water Holder to manage water in the catchment.

### Expected environmental water volumes available at 1 July 2019

</table>

**Note:** This is an indicative summary of volumes expected to be available. For further detail and information on available volumes, please contact the region via DPIE enquiries on 1300 361 967.

1 gigalitre = 1000 megalitres
2.5 megalitre = 1 Olympic swimming pool

**What is water for the environment?**

Water for the environment is a share of the water in dams and rivers that is set aside to support the long-term health of local rivers, creeks and wetlands. Healthy rivers carry water to homes, farms, schools and businesses. In the Murrumbidgee catchment, rivers and wetlands are important cultural and spiritual sites for Aboriginal people, as well as the broader community.

### About the Murrumbidgee catchment

The Murrumbidgee catchment covers 81,527 square kilometres and includes 26 storage or diversion structures, 1690 kilometres of the river and surrounding wetlands. The climate conditions range from alpine in the Snowy Mountains to semi-arid on the Riverina plains.

**Water for rivers and wetlands**

In 2019–20, water managers will continue to build on the success of previous years through the careful management of water for the environment.

During 2018–19, Department of Planning, Industry and Environment (DPIE) worked with the Commonwealth Environmental Water Office to deliver around 130 gigalitres of water for the environment to Yanga National Park and North Redbank wetlands. Flows in the lower Murrumbidgee improved native fish habitat following record heat wave conditions and an associated fish kill at Redbank weir pool. Water was also used to maintain refuge habitats in the Murrumbidgee and Coleambally irrigation areas, Gayini Nimmie-Caira and Junction (Murrumbidgee and Murray) wetlands.

This year managed watering events will focus on maintaining drought refuge habitat for southern bell frogs, native fish, waterbirds and other aquatic species.

**Weather and water forecast**

In the Murrumbidgee catchment, warmer and drier than average conditions are forecast for May to July 2019, with the possibility of continuing dry conditions as the 2019–20 season progresses. Water management plans reflect this dry outlook.

Water managers have prepared watering plans that take into consideration a range of weather and water availability scenarios in case it rains more or less than expected. This is known as Resource Availability Scenario planning. Dry to very dry conditions are forecast for the Murrumbidgee catchment in 2019–20.

**Resource availability scenario**

**Very dry**

**Main aim: Protect**

- Avoid critical loss
- Maintain key refuges
- Avoid catastrophic events

**Dry**

**Main aim: Maintain**

- Maintain river functioning
- Maintain key functions of high priority wetlands

**Moderate**

**Main aim: Recover**

- Improve ecological health and resilience
- Improve opportunities for plants and animals to breed, move and thrive

**Wet to very wet**

**Main aim: Enhance**

- Restore key floodplain and wetland linkages
- Enhance opportunities for plants and animals to breed, move and thrive

**Key planned actions for 2019–20**

**Waterbirds**

- Flows (up to 30 gigalitres) are planned to provide refuge habitat for waterbirds, turtles, frogs and other aquatic species in core areas of Yanga National Park, Gayini Nimmie-Caira and North Redbank wetlands. Key Australasian bittern habitat will be watered in the Murrumbidgee and Coleambally irrigation areas and Yanco Creek systems.

**Native fish**

- If resource availability improves significantly flows (up to 20 gigalitres) are planned to maintain instream and deep water off-stream habitats for native fish and restore a more natural flow pattern to support native fish populations.

**Connectivity**

- If resource availability improves significantly, flows (up to 50 gigalitres) are planned to connect the Lowbidgee lakes and facilitate the removal of the effects of three weirs within the lower Murrumbidgee river channel (assumes significant resource improvement or supplementary access).

**Vegetation**

- Key mid-Murrumbidgee sites including Yarradda, Darlington, Gooragool and Mantangry lagoons will be provided with water via pumping (10 gigalitres).
