Control of Woody Weeds

Examples of woody weeds include:
- lantana, bitou bush, cotoneaster, privet (cut and paint)
- camphor laurel, Mickey Mouse bush (ochna) and cassia/senna (stem scrape)

METHODS OF REMOVAL

1 CUT AND PAINT — Useful for small to medium sized woody weeds up to 10cm basal diameter

STEP 1
Make a horizontal cut as close to the ground as possible with secateurs, loppers or a bush saw.

STEP 2
Immediately apply herbicide to the exposed flat stump surface.

SAFETY CONSIDERATIONS

The following general precautions should be made when using herbicides:
- Read the label before opening the container and follow the instructions.
- Wear protective clothing as directed on the label.
- Wash hands after use and before eating or smoking.

Considerations

- Cuts should be horizontal to prevent herbicide from running off the stump. Sharp angle cuts are hazardous.
- Herbicide must be applied immediately before the plant cells close and translocation of herbicide ceases.
- If plants resprout, cut and paint the shoots after sufficient regrowth has occurred.
- Stem scraping can be more effective on some woody weeds.
Control of Woody Weeds cont..

METHODS OF REMOVAL

2 STEM INJECTION
3 FRILLING OR CHIPPING

For use on larger shrubs or trees above 10cm basal diameter and in inaccessible sites where removal is a problem.

STEP 1

INJECTION: At the base of the tree drill holes at a 45 degree angle into the sapwood at 5 cm intervals.

OR

FRILL/CHIP Make a cut into the sapwood with a chisel or axe.

STEP 2

Fill each hole/cut with herbicide immediately.

STEP 3

Repeat the process at 5 cm intervals around the tree.

Considerations

- Plants should be healthy and actively growing.

Deciduous plants should be treated in spring and autumn when leaves are fully formed.

- For multi-stemmed plants, inject or chip below the lowest branch or treat each stem individually.

- Herbicide must be injected immediately before the plant cells close (within 30 seconds) and translocation of herbicide ceases.
