

Threatened species

Central West region

State Plan target

By 2015 there is an increase in the recovery of threatened species, populations and ecological communities.

Background

The *Threatened Species Conservation Act 1995* and *Fisheries Management Act 1994* list species, populations and ecological communities that are at high risk of extinction. A total of 172 threatened species occur or did occur within the Central West region (Table 1).

A detailed technical report describes the methods used to derive the information contained in this report. At the time of publication of the *State of the catchments (SOC) 2010* reports, the technical reports were being prepared for public release. When complete, they will be available on the DECCW website: www.environment.nsw.gov.au/publications/reporting.htm.

Note: All data on natural resource condition, pressures and management activity included in this SOC report, as well as the technical report, was collected up to January 2009.

Table 1 The number of species listed under the *Threatened Species Conservation Act 1995* or *Fisheries Management Act 1994* that occur or did occur in the Central West region. The categories reflect different levels of extinction risk ('critically endangered' indicates the highest risk, and 'vulnerable' the lowest).

	Presumed extinct	Critically endangered	Endangered	Vulnerable	Total
Fauna					
Mammals	6	0	5	24	35
Birds	0	1	14	44	59
Amphibians	0	0	6	3	9
Reptiles	0	0	3	5	8
Fish	0	0	2	1	3
Invertebrates	0	0	3	0	3
Flora					
Plants	2	0	21	32	55
Algae	0	0	0	0	0
Fungi	0	0	0	0	0
Regional total	8	1	54	109	172
State total	76	21	549	409	1055

Map of the catchment

Assessment

Condition

Indicator: sustainability of threatened fauna and flora

Consistent with the intent of threatened species legislation, recovery is defined here as a decline in the risk of extinction. This is equivalent to an increase in the likelihood of a species being sustained. The sustainability of threatened fauna and flora species within the region was assessed using modified IUCN Red-List Criteria (IUCN 2001). In particular, estimates of total population size and distribution, trends in population size and distribution over time, and direct estimates of extinction risk from population modelling were used to score sustainability for each species at the regional scale. Species were assessed only if they were being actively monitored at a regional or larger scale. Endangered populations were not assessed.

Excluding species listed as presumed extinct, the sustainability of only five threatened fauna species could be assessed in the Central West region, none of which scored good or very good. In comparison, the sustainability of 31 threatened fauna species was assessed at the state scale, of which two (six per cent) scored good or very good. No threatened flora species could be assessed for sustainability in the Central West region. In comparison, the sustainability of 11 threatened flora species was assessed at the state scale, of which two (18 per cent) scored good or very good.

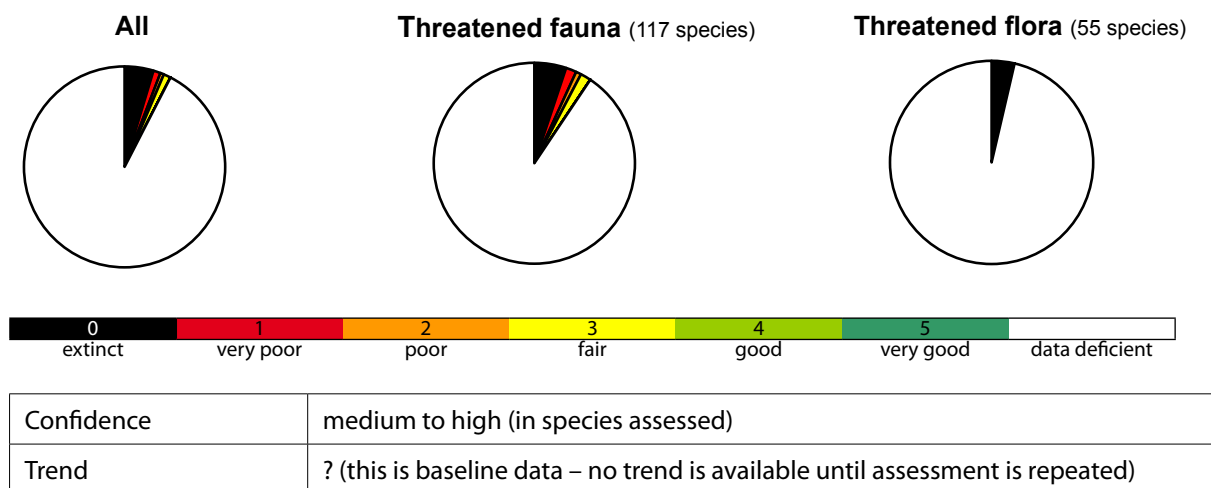

Figure 1 Sustainability of threatened fauna and flora within the Central West region, assessed using modified IUCN Red-List Criteria (numbers are the scores used in the threatened species recovery assessment)

Index of threatened species' recovery

An index of threatened species' recovery was calculated as the mean of sustainability scores for all threatened entities that were able to be assessed. However, given that sustainability scores were available for only five of 164 threatened species within the region (excluding the eight species presumed extinct), the index is inadequate without an increase in the number of threatened species being monitored.

Pressures

Major pressures on threatened species in New South Wales include:

- the introduction of exotic animals and plants (see the invasive species report)
- the clearing and disturbance of native vegetation (see the native vegetation report)
- changes to fire regimes
- changes to water flows (see the riverine ecosystems, groundwater dependent ecosystems, and wetlands reports)
- the introduction of exotic diseases
- overfishing and fishing by-catch.

The interaction between these pressures and their relationship with trends in the status of threatened species are complex and cannot easily be summarised.

Pressure case study: Box Gum Woodland

Figure 2 Condition of the White Box Yellow Box Blakely's Red Gum Woodland EEC in the Central West region (data: DECCW unpublished)

White Box Yellow Box Blakely's Red Gum Woodland is a severely cleared and degraded endangered ecological community (EEC). It is found in five vegetation types in the Central West region, which, on average, have been cleared by more than 90 per cent.

Patches of the EEC were sampled throughout NSW between 2004 and 2007. Of the 69 patches sampled in the catchment, more than half rated as being in a good or very good condition. There was a wide range of patch sizes, from less than one ha to over 1000 ha, but no relationship was found between patch size and condition.

Management activity

State level

There are a number of critical actions to improve the condition of threatened species, especially relating to the management of exotic animals and plants (pests), the condition and extent of native vegetation, water use and fire. Some of these actions are described briefly in the fauna report. Targeted actions to recover threatened species, populations and endangered ecological communities, and to manage key threatening processes, are described in the threatened species priorities action statement (PAS) for each species. This includes surveys to clarify the distribution of a species, weed and pest management programs, guidelines for threatened species issues in development assessments, research into factors influencing the survival of threatened species, and community education programs. Funding all PAS actions remains a challenge for government agencies; while there are numerous species listed as threatened, only a few are managed under recovery plans. Some threats, most notably those posed by cats and chytrid fungus, remain largely unaddressed due to the lack of effective control techniques.

Other actions include:

- protection and rehabilitation, through:
 - preparing nominations for threatened ecological communities for the Scientific Committee and preparing identification guidelines
 - preparing recovery plans
- research, including:
 - collecting, storing and researching the seeds of NSW flora, through the NSW Seedbank's SeedQuest program. To date, 35 per cent of NSW species, including 30 per cent of the state's threatened species, are represented in the seedbank. Seed-related information (eg germination and viability information) is available on most species collected. Where possible, representative populations of threatened species are held in the seedbank and may be available for translocation or research
 - an ongoing program of botanical research into the plants of NSW, run by the National Herbarium of NSW at the Botanic Gardens Trust. This research includes the identification and description of threatened plant, algal and fungal species. The identification and naming of threatened species is the first key step in understanding these species
- education, including:
 - Industry & Investment NSW (I&I) courses on subjects including property management planning for natural resources management and vertebrate pest management. More information on I&I courses is available at www.dpi.nsw.gov.au/agriculture/profarm/courses.

Regional level

At the regional level, the Central West Catchment Management Authority is undertaking the following activities in relation to the threatened species target:

- incentive projects to assist the recovery of threatened species or communities
- offering habitat restoration incentives with biodiversity outcomes – eg in-stream habitat or native revegetation – to improve connectivity across the landscape and restore ecological function

- managing remnant vegetation for biodiversity (native plant regeneration, weed/pest control, and retention of habitat features)
- conducting community consultation on important natural resource management (NRM) issues
- offering support to other groups and individuals for NRM activities
- monitoring activities with government/s and/or landholders across the catchment.

Local level

Other groups are working in the region to contribute to better outcomes for threatened species. These groups include:

- landholders/primary producers within the Central West catchment
- Aboriginal communities
- community groups (including Landcare groups)
- local councils and urban communities
- educational institutions including universities, TAFE and schools.
